

## Using Sony's VCL-EX0877 - 0.8x wide conversion lens on EX1 & EX3 cameras

### Q - Why do I need to use the 'Wide Conversion Function' on a Sony EX1 or EX3?

A - The Sony VCL-EX0877 is the 0.8x wide conversion lens for the Sony PMW-EX1 & PMW-EX3 camcorders. With the VCL-EX0877 mounted to either the EX1 or EX3 the focal length becomes 25.1mm to 351mm (31.4mm to 439mm in 35mm equivalent). The EX1 & EX3 cameras have an optical specification compensator function. By changing 'Wide Conversion' in the 'Camera Set' menu to "On" manually, chromatic aberration (CA) compensation & the image stabilizer mode is optimized for the VCL-EX0877.

### Q – What if I decide to use a Century wide conversion adapter instead of a Sony? Would I still need to select the 'Wide Conversion Function' on an EX1 or EX3?

A - In the opinion of Century's David Contreras it can be in either position. However, he suggests to try it in both positions & look for any noticeable changes to be sure.
